CHAPTER 01

Welcome to the machine

The Divine Music Machine turns a spark into a finished song: beat, bass, chords, pad, melody and an answer melody on one screen, ready as MIDI files for your DAW. You lead, the machine follows. Every part can be yours, the machine's, or switched off, and whatever you play, the machine bends the rest around it.

The Divine Music Machine with a full hip hop song playing

A few promises before you start:

Nothing breaks

Every change can be undone with the arrows in the top bar, or Ctrl+Z.

Nothing is hidden

Everything you need sits on this one screen. No menus inside menus.

You hear it right away

Every tap sounds, also while the music plays, and changes play from the next bar, so you can steer while the music runs.

Your choice of language

This manual comes in English, Nederlands and Deutsch. The app itself speaks English.

The machine is made for the Divine Monday sound: it knows six genre moods, writes clean MIDI with section markers, and prepares files for UJAM plugins so they land in the right key zones. Take your time, press things,

listen. That is exactly how it is meant to be used.

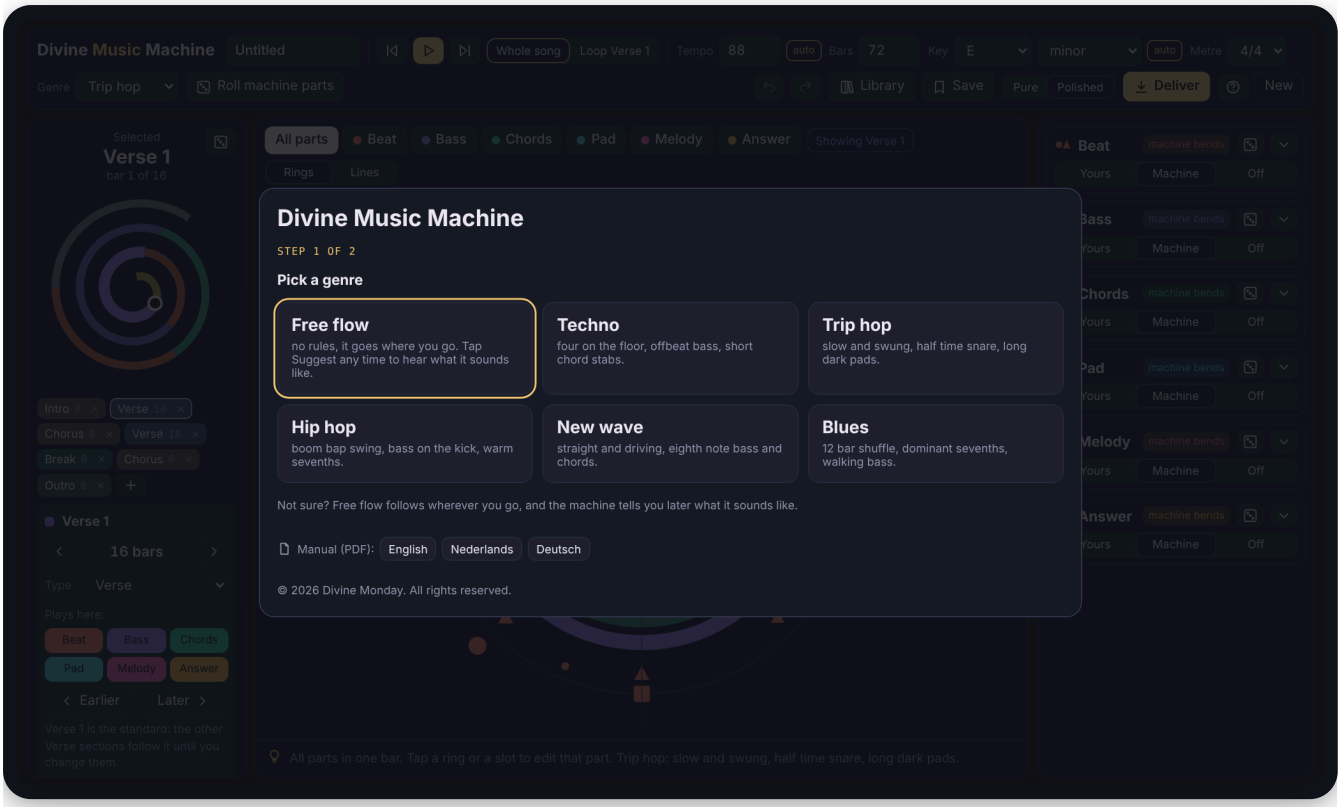

CHAPTER 02

Start: two small steps

Every new song starts with two questions: which genre, and how do you want to begin. Both can be changed later, so there is no wrong answer.

Step 1: pick a genre

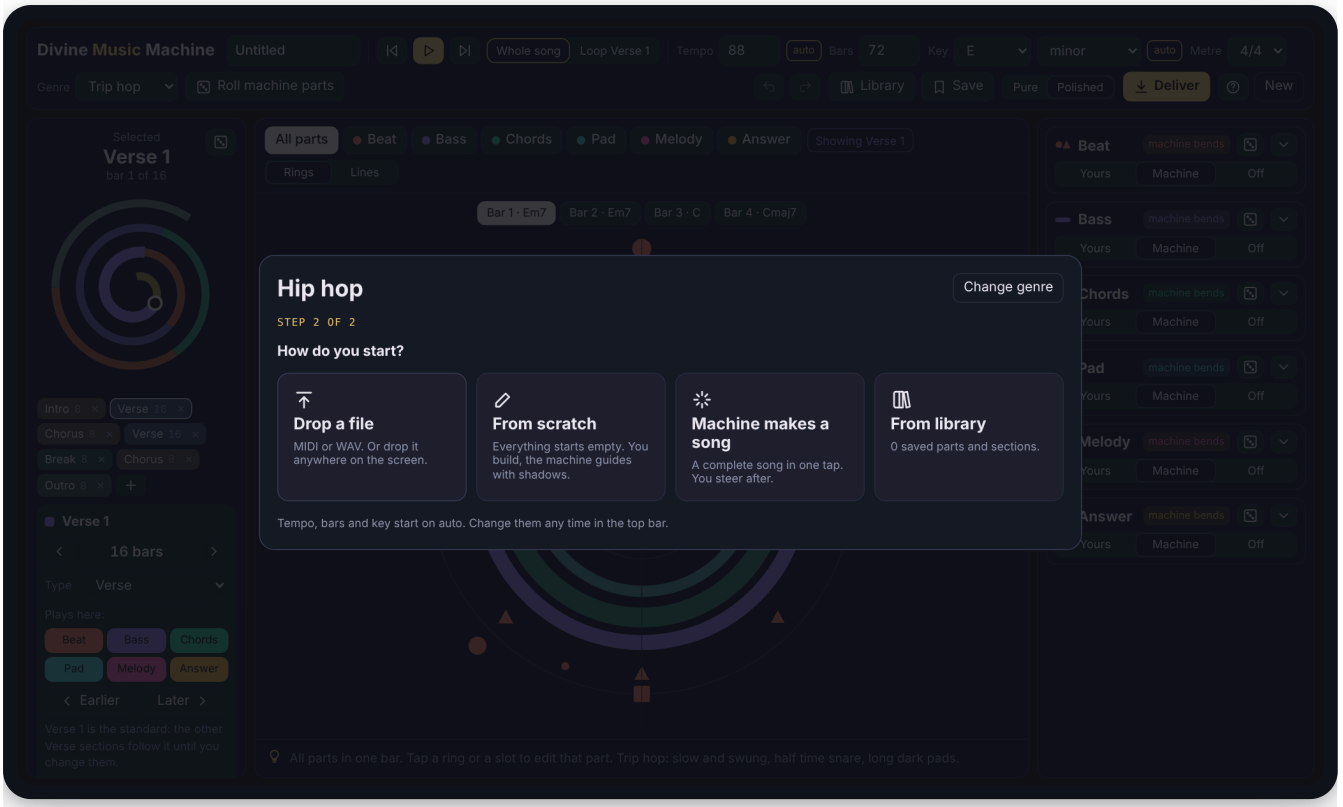

Step 1: the six genres

GENRE	WHAT IT GIVES YOU
Free flow	No rules. It goes where you go. Press **Suggest** in the top bar any time to hear which genre it sounds like, with the reasons why.
Techno	Four on the floor, offbeat bass, short chord stabs.
Trip hop	Slow and swung, half time snare, long dark pads.
Hip hop	Boom bap swing, bass on the kick, warm sevenths.
New wave	Straight and driving, eighth note bass and chords.
Blues	12 bar shuffle, dominant sevenths, walking bass. The bars show as written: three lines of four.

Changing the genre later in the top bar also reshapes the parts you made yourself: your beat moves to the new groove, your chords take the new colours. Did not like it? One undo brings everything back.

Step 2: how do you start?

Step 2: four ways to begin

Drop a file

A MIDI or WAV file. You can also drop it anywhere on the screen, any time. The machine reads tempo, key and notes, and asks which part each track is.

From scratch

Everything starts empty, the song structure included. You build, the machine guides you with shadows.

Machine makes a song

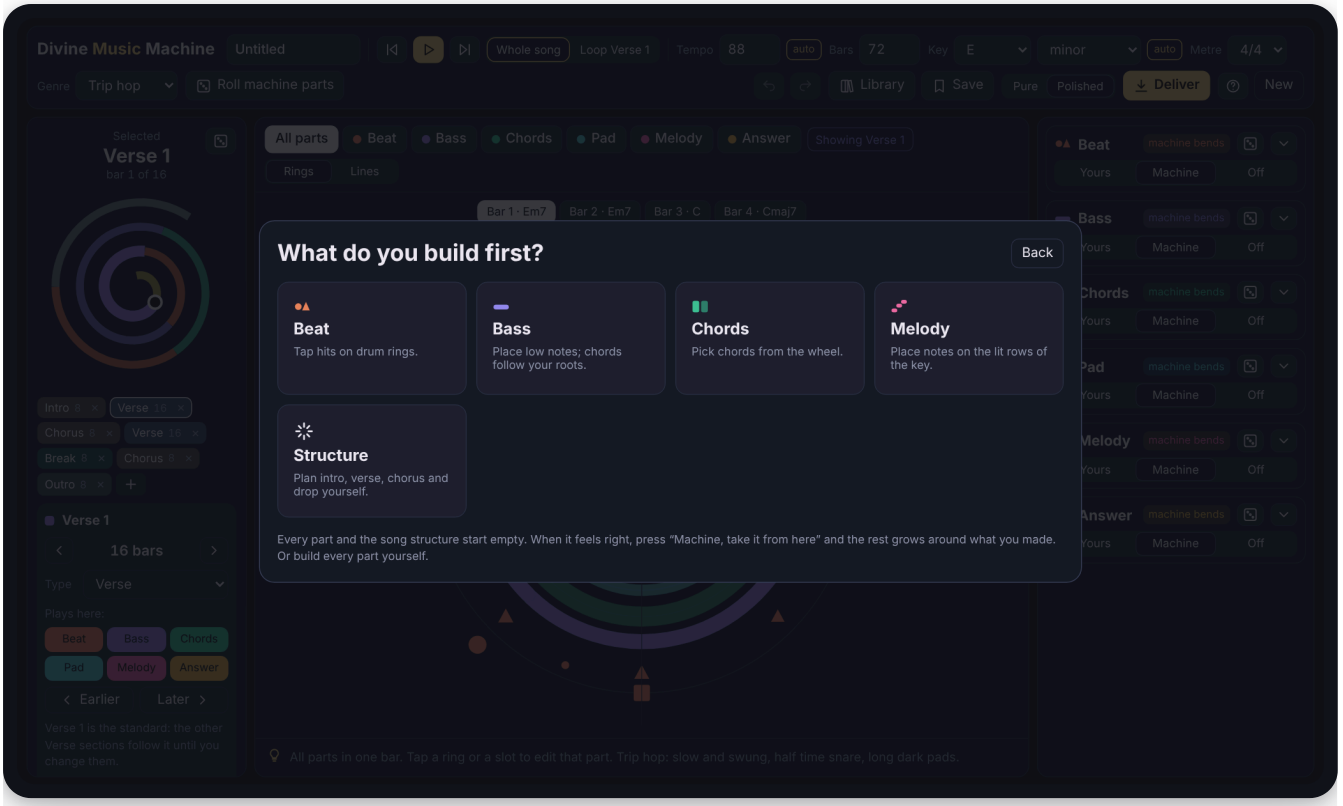

A complete song in one tap. You steer after.

From library

Start from parts and sections you saved earlier.

Tempo, bars and key start on **auto**. Change them any time in the top bar.

From scratch: what do you build first?

From scratch: choose your first part

Pick Beat, Bass, Chords, Melody or Structure. When it feels right, press **Machine, take it from here** and the rest grows around what you made. Or simply build every part yourself.

CHAPTER 03

The screen at a glance

Everything lives on one screen in five areas. Your eyes travel left to right: the song, what you are editing, who plays it.

Top bar, row 1

Song name, play, Whole song or Loop section, Continue song, tempo, bars, key, metre

Top bar, row 2

Genre, Suggest, Machine take it from here, Roll machine parts, undo and redo, Library, Save, Pure or Polished, Deliver, help, New

Left: your song

Spiral: the whole song
Dot: where you are now
Chips: tap one to select it
The x on a chip deletes it
Panel: length, type, move
Now playing: name and bar

Centre: the editor

Tabs: All parts or one part at a time
Rings or Lines: two views, same notes
Shadows: machine ideas, tap to keep
Random and Clear for the open part
Badge: which section you edit
Hint line at the foot: what next

Right: six part slots

Yours, Machine or Off
Tap a slot to open it
Played by: the plugin
Feel pad: groove and timing
Dice: a fresh idea
Badge: who bends to whom

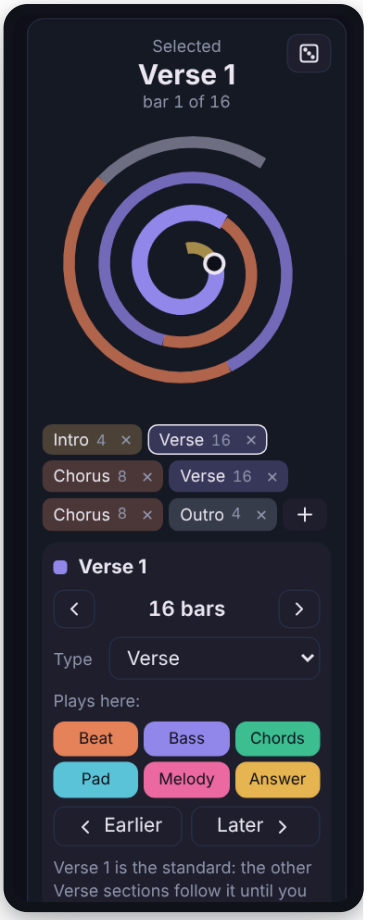

The editor in the middle is where you spend most of your time; the other areas frame it.

Top bar

The top bar has two rows. The first row is the song itself: give it a name, press play, and choose what you hear: **Whole song** plays everything from start to end, **Loop** repeats the selected section, Loop bar repeats only the bar you have open in the editor, so you can work on one bar at a time. Tempo, bars and key have an **auto** switch: on auto the machine decides, the moment you type a value it is yours. The second row is what you do with the song: the genre (with Suggest in Free flow), Machine, take it from here, Roll machine parts (new ideas for every part the machine plays, while your own parts stay), undo and redo, Library, Save, Pure or Polished, Deliver, help and **New**. New really means a completely new song, starting again at Untitled.

Left: your song

The spiral is your whole song, rolled up like a vinyl groove. Each colour is a section, the dot shows where the music is right now. Below it, the chips list the sections in order. Tap a chip to select that section and look at it quietly; press play to hear it from its start. While the music plays, a tap jumps straight there. Tap its **x** to delete it. Under the chips, the selected section has its own panel: the arrows set its length, **Type** changes what kind of section it is, and **Earlier** and **Later** move it.

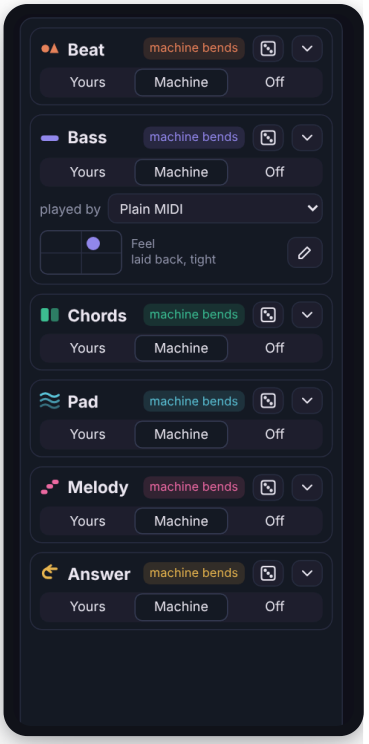

The song spiral and the section chips

Right: the part slots

One slot per part: Beat, Bass, Chords, Pad, Melody and Answer. To keep things calm the slots stay closed; the part you edit opens by itself, and a tap on any slot opens or closes it. An open slot answers three questions:

1. **Who writes it?** Yours, Machine or Off.
2. **Who plays it?** Plain MIDI or one of the UJAM plugins.
3. **How does it feel?** Drag the dot in the Feel pad: left is ahead of the beat, right is laid back, top is tight, bottom is loose.

The dice gives a fresh idea for that part that fits the key and the chords, always something different from what was there (with Undo and Redo in the little message that pops up). The pencil opens the part in the editor. The small badge tells you who follows whom: **yours, leads** means the machine bends around your part; **machine bends** means this part is adapting to yours.

The six part slots, the bass slot open

Pure, Polished and Deliver

In the second row of the top bar, choose **Pure** (exactly what was played) or **Polished** (notes nudged into key, parts in their own range, loudness balanced). **Save** keeps a part or section in your library for later; **Deliver** opens the files.

CHAPTER 04

Building your parts

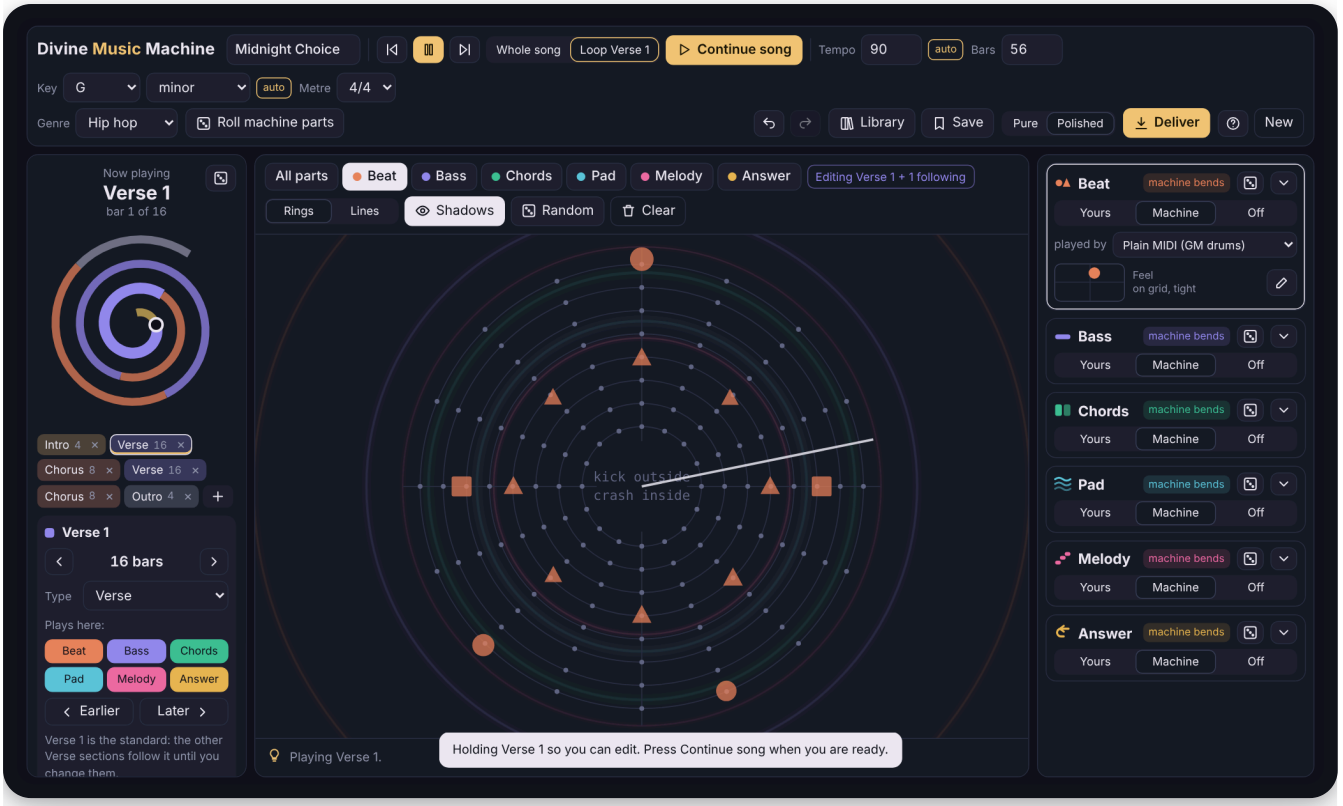

Three gestures do almost everything, in every editor: **one tap listens, a double tap removes, a drag changes.** You cannot break anything by touching it.

GESTURE	WHAT HAPPENS
Tap an empty spot	Places a hit there, or a note of one slice
Tap a hit or note	You hear it. Nothing changes
Double tap a hit or note	Removes it
Drag a beat hit outward	Louder (further out is louder)
Pull the small circle at the end of a note	Longer or shorter
Hold a note	A loudness fader appears: up is louder, then Done
Tap a dashed shadow	Keeps the machine's suggestion as yours

Every editor has two views, **Rings** and **Lines**. They show the same music: rings feel like a turntable, lines like a classic piano roll. Switch whenever you like. In All parts, the bar buttons above the rings let you look at any bar of the selected section; tap a ring there and that part opens on the same bar, ready to change. A part that rests in that section, like the melody in an Intro, is drawn faint with a small note in the centre; switch it on under Plays here if you want it. While the music plays, soft rings spread behind the editor like ripples on water, one for every hit and note, in the colour of its part. They never get in the way of your taps.

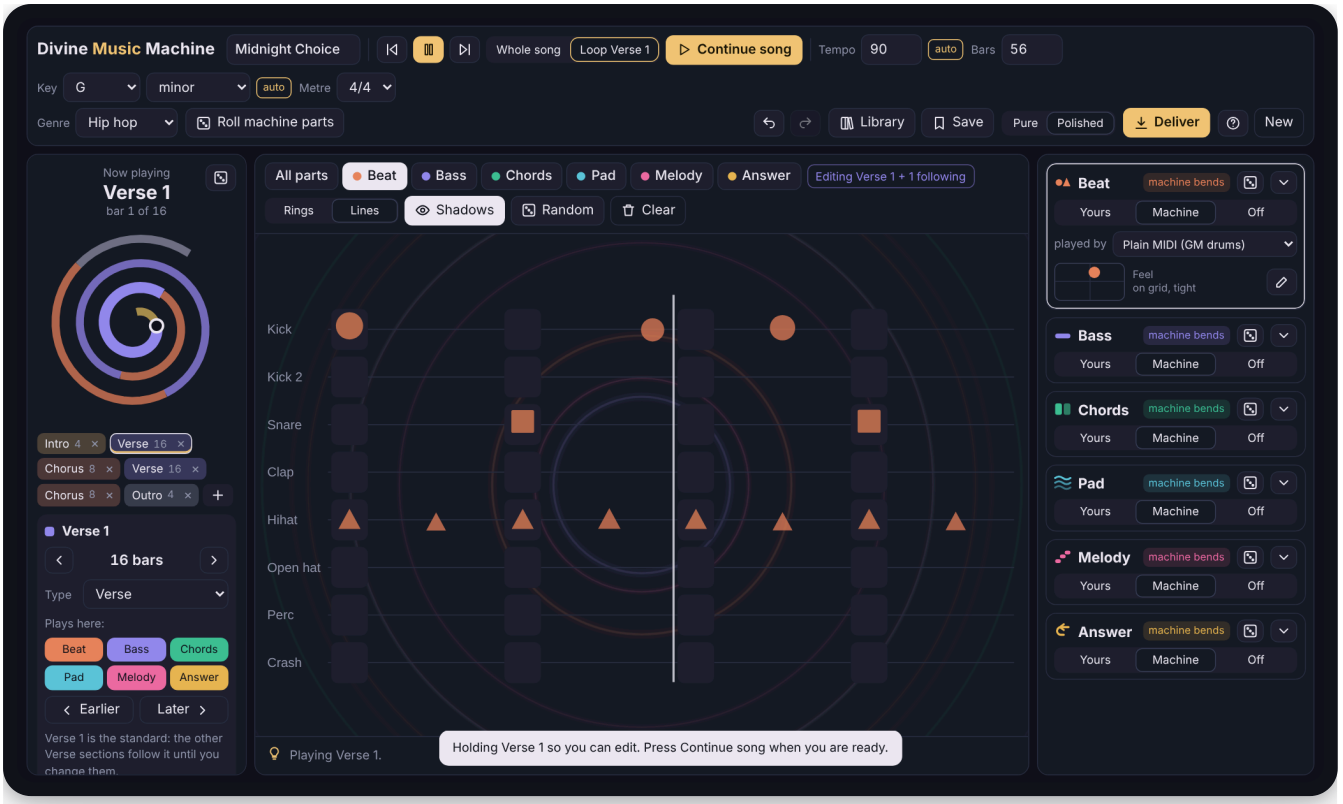

Beat

Beat rings: one ring per drum

One ring per drum, the bar runs clockwise from the top like a clock. Kick sits outside, crash inside. Each drum has its own shape, so you can read the groove without colours:

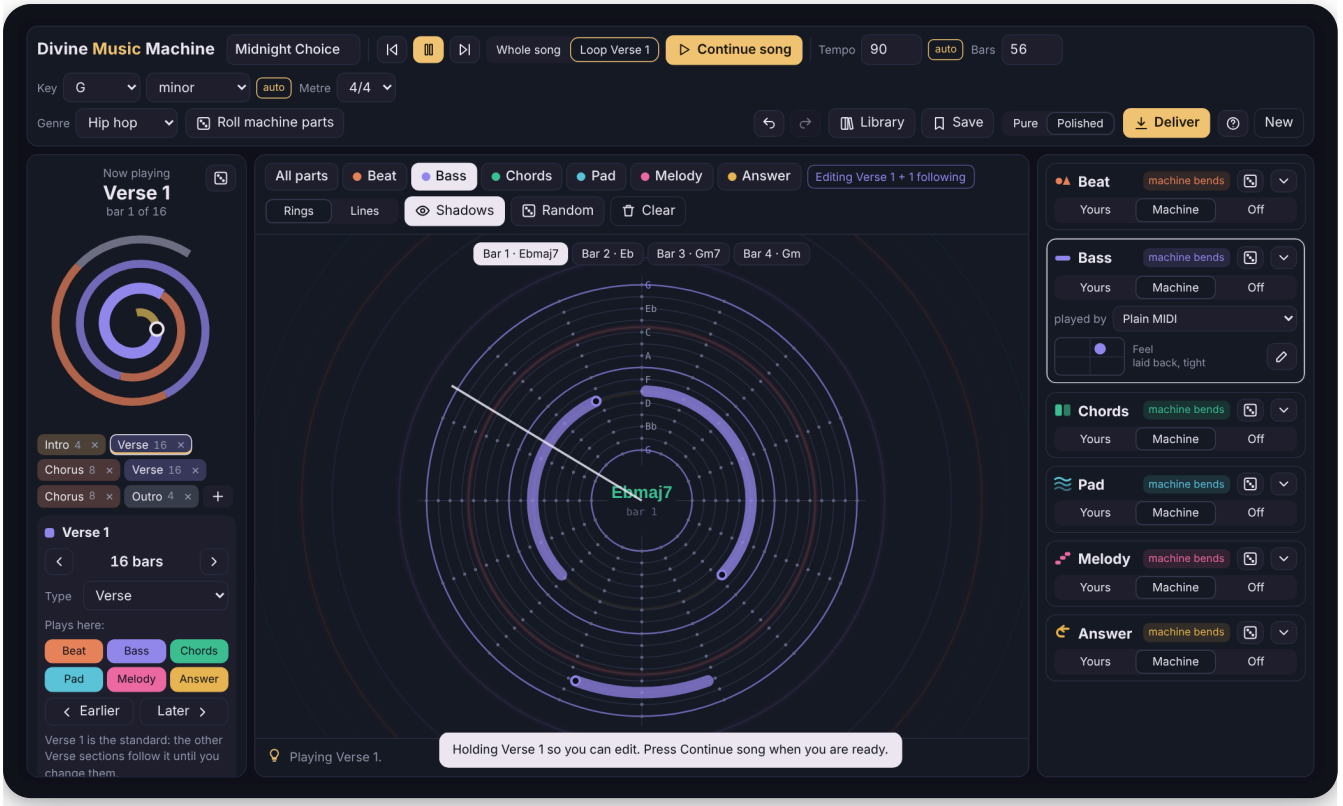

RING	DRUM	SHAPE
1 (outside)	Kick	circle
2	Kick 2	ring
3	Snare	square
4	Clap	diamond
5	Hihat	triangle
6	Open hat	open triangle
7	Perc	dot
8 (inside)	Crash	star

The same beat as Lines

Fills you can see. The beat is one pattern for the whole section; the machine adds a little on top in some bars, like a snare fill in the last bar before a new section. Pick a bar in the tabs above the beat and those extra hits show as soft shapes, with a label such as *Bar 12: machine fill into Verse*.

Bass

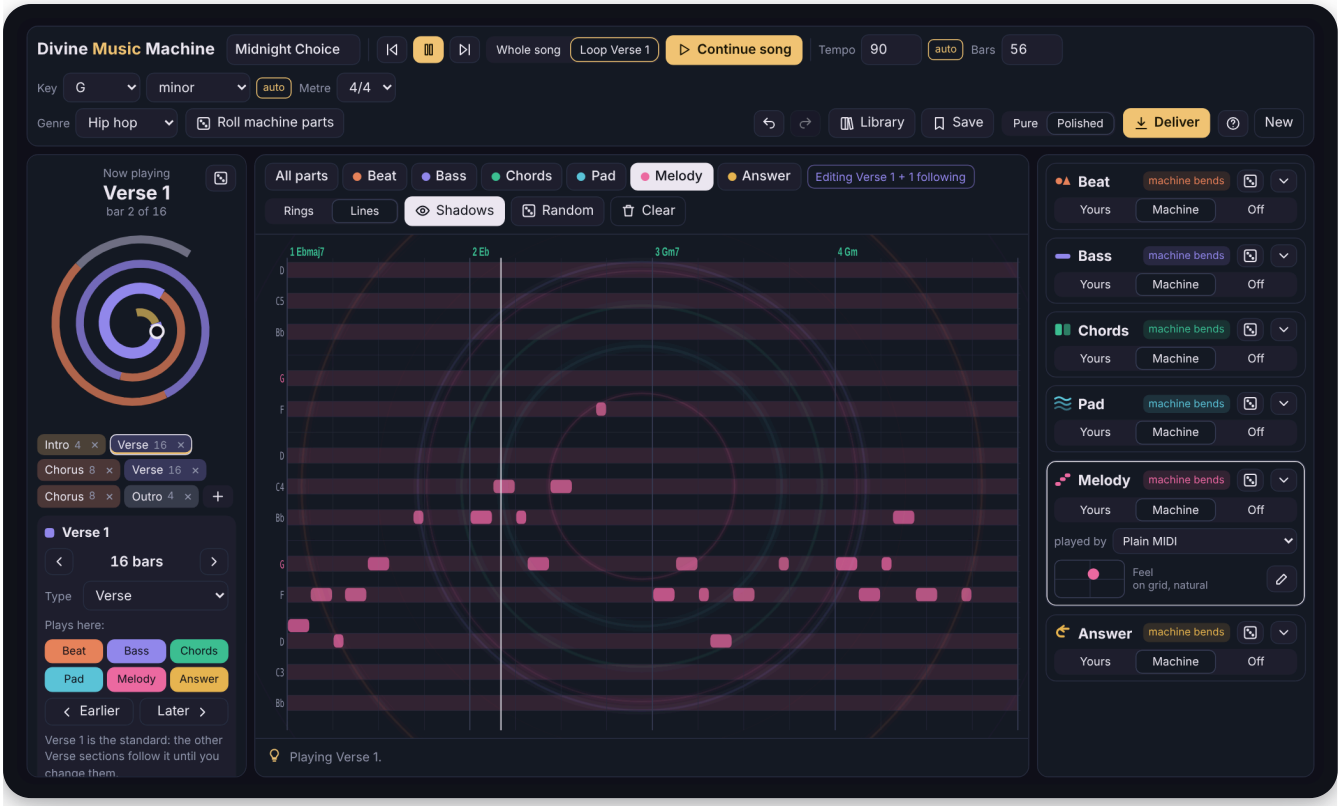

Bass rings with a tab per bar

Each ring is a note of the key, so every lit ring fits. The tabs above show each bar with its chord, tap one to edit that bar. Your bass roots tell the machine which chords to play, and your bass rhythm helps shape the kick.

Repeat bar 1. Make only your first bar and the machine fills the empty bars for you: it copies your line and moves it along with the chord of each bar, always in key, with a small turn in the last bar. The copies show as soft echoes. Tap an echo to make that bar yours, or switch it off with the **Repeat bar 1** button. This works for bass, pad, melody and answer.

Melody

Melody as Lines: the rows of the key are lit

The lit rows belong to the key, so anything you place on them sounds right. The chord of each bar is written above the grid. Pull the small circle at a note's end to lengthen it, drag the middle to move it, hold a note for its loudness fader.

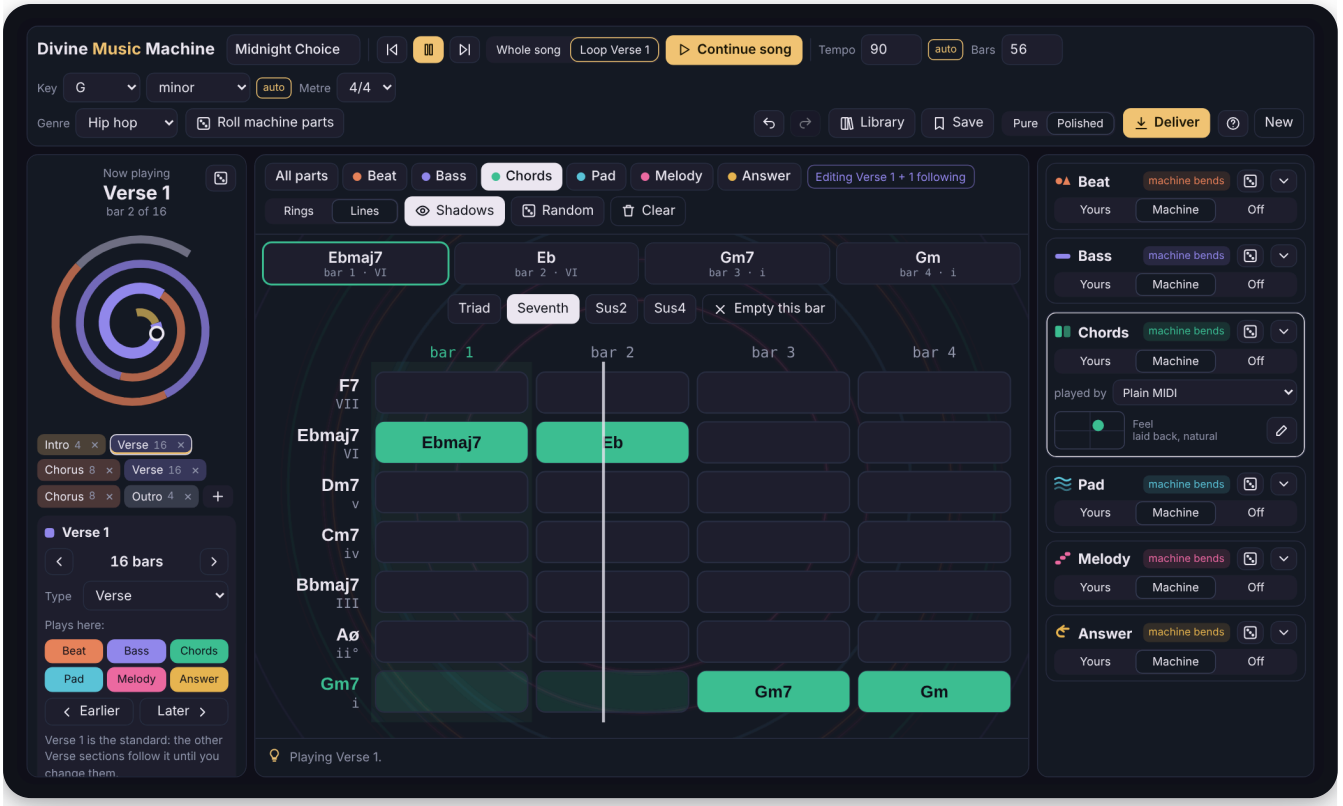

Pad

The pad is a soft bed of long chord tones under everything. The machine makes it from your chords, so it always fits: held, swelling, or pulsing in the chorus. It has its own slot, its own plugin choice and its own MIDI file. Make it yours to change the voicing in rings or lines, or switch it off.

Answer

The answer is a second melody that replies to the main one. It listens to where your melody breathes and answers in those rests with a turn of your last phrase, a third or a sixth lower, in the same scale. You never have to write it: it comes for free with every melody, also from scratch. Make it yours to change anything, or switch it off.

Chords

Chord rings: one ring per chord of the key, one slice per bar

Chords work like the other parts. In Rings each ring is one chord of your key, with I in the middle, and the circle is cut into one slice per bar. In Lines each row is a chord and each column a bar. Tap a ring in a slice, or a box in a column, and that bar gets that chord. Tap it again to hear it, double tap to empty the bar. The row of bars on top shows the whole progression; tap one to select it. Make it richer with **Triad**, **Seventh**, **Sus2** or **Sus4**, or leave a bar silent with **Empty this bar**.

Fill empty bars. Pick only your first chord and the machine fills the empty bars with a progression that continues from it. Those chords show as dashed echoes; tap a chord to make a bar yours, or switch it off with **Fill empty bars**.

Shadows, Random and Clear

Shadows are the dashed shapes: the machine's suggestions for what could come next. They change after every hit you place. Tap one to keep it, or switch them off with the Shadows button. **Random** gives the open part a fresh idea within the key and chords, always different from what was there; **Clear** empties it so you can start fresh. Both can be undone.

CHAPTER 05

Song structure, playing and looping

A song is a row of sections. The first section of each type is the standard; the later ones follow it until you change them. Change Verse 1 and every Verse that follows changes along. Change something in Verse 2 and only Verse 2 changes: it gets its own version, marked with a small dot on its chip. In the section panel, Vary gives a section a light variation with one tap, and the ↻ button makes it follow the standard again. The badge above the editor always says what you change, for example **Editing Verse 2 only**.

05

Where your change lands. Above the editor, **Change** shows where your next change goes: **Bar 3 only**, **Verse 1 only** or **Every Verse**. Change a bar that already plays something and only that bar changes; its tab gets a dot, and **↻ Bar 3 follows** lets it play like the rest of the section again. Build in an empty bar and your notes go into the pattern, so they repeat. Tap another choice whenever you like. A section type you never touched plays the machine's own version, so nothing you made turns up there by surprise.

The beat: bar 1 is the base. In every section, what you do in bar 1 of the beat plays in all its bars. In the other bars you start from that base and change only that bar. Did bar 1 get a version of its own earlier? Then **Make bar 1 the base** puts that rhythm in every bar of the section.

Copy a beat to every section of its type. Happy with the beat of Verse 2, base and changed bars included? In the section panel, **Copy beat of Verse 2 to every Verse** gives every Verse exactly that beat, bar for bar. A longer Verse plays the base in its extra bars; a shorter one leaves out the bars that do not fit. Undo brings everything back.

Building the structure

The chips on the left are your sections in order. Tap **+** to add one after the selected section; while the music plays, you hear it right away. Lengths go in whole patterns: 4, 8, 12 bars and up, in blues per 12, and a Fill is 1 or 2 bars. The dice at the top right of the spiral gives a whole new structure in your genre, with intro first and outro last; your parts come along. Change the kind of section in the **Type** menu and move it with **Earlier** and **Later**. Changed or deleted one by accident? The little message that appears offers Undo.

While the whole song plays, changing a section holds it on loop, just like editing a part. Press **Continue song** to play on.

Plays here. Under Type you see which parts play in this section. Tap one to silence it here or to bring it in: no melody in the Intro, no beat in the Break. Other sections stay as they are.

Start from. Building a new Chorus? Choose **Start from** your Verse and your own parts are copied over as a starting point. Change them freely afterwards.

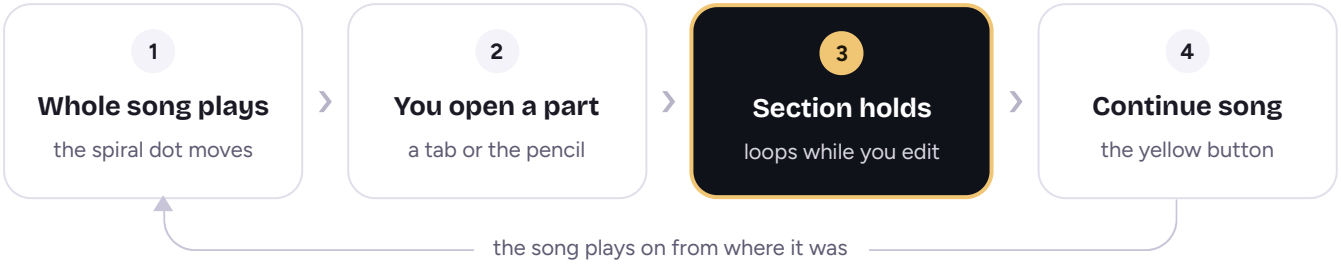

SECTION	TYPICAL ROLE
Intro	Opens the song, often lighter
Verse	The story, room for the melody
Pre chorus	Lifts the energy towards the chorus
Chorus	The main hook, fullest part
Build	Rising tension
Drop	The big moment after a build
Break	A breather, parts drop away
Fill	A short turn between sections
Outro	Closes the song with a final hit

In blues every section is a full 12 bar round, so the classic shuffle form stays intact.

Where am I playing?

Three things always tell you: the **Now playing** name with its bar number above the spiral, the dot on the spiral, and the scope in the top bar. The selected section always follows what you hear. **Whole song** plays from start to end; **Loop** repeats only the selected section. When the music is stopped, tapping a section chip or a colour on the spiral only selects it, so you can browse your song like a table of contents and edit in peace; play then starts from that section. While playing, a tap jumps there, and with Loop on it keeps repeating the section you tapped, handy while you work on it; the arrows next to play jump to the previous or next section.

Holding a section while you edit

When the whole song is playing and you open a part to edit, the machine holds that section and loops it, so you never chase your music around the song. A bright **Continue song** button appears; press it when you are ready and the song plays on. Every change you make is heard from the next bar.

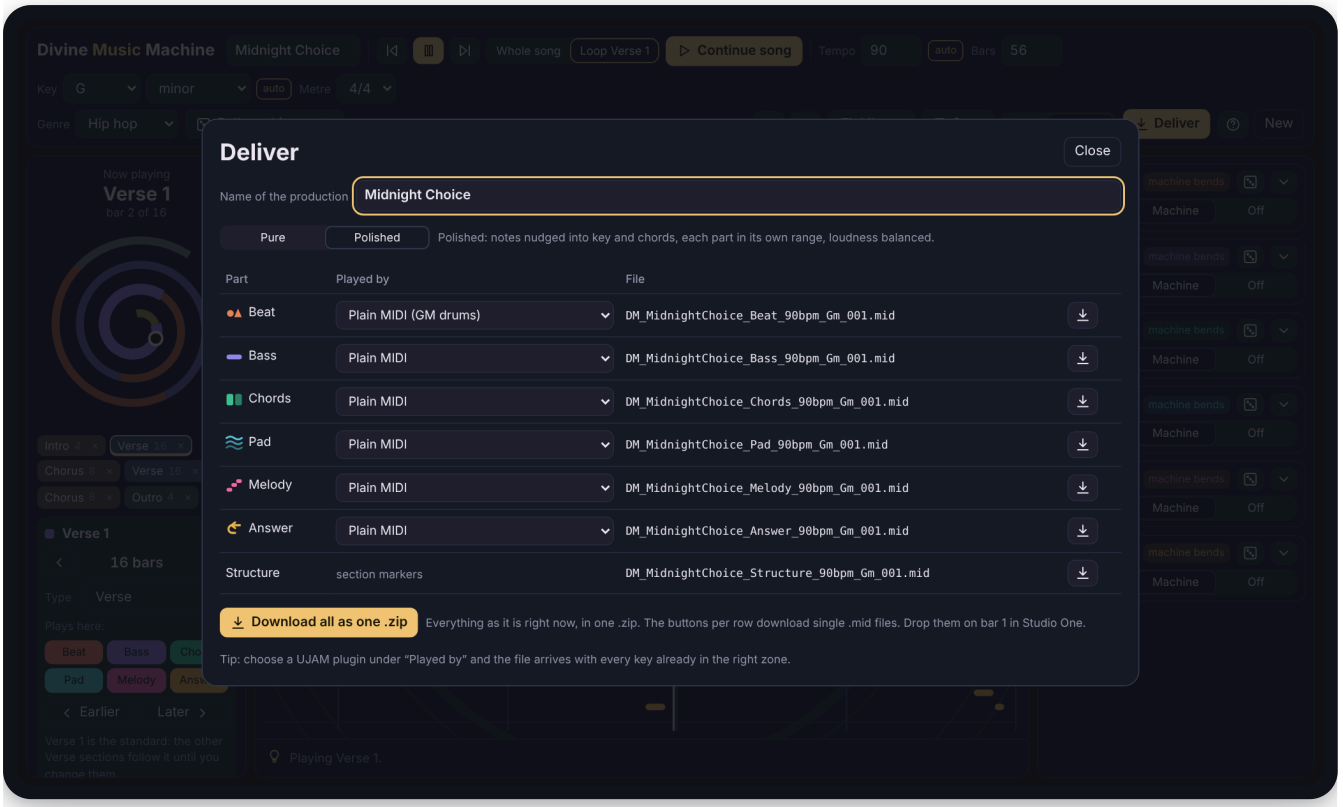

Handy keys: **Space** plays or pauses, the **left and right arrows** move to the previous or next section, **Ctrl+Z** undoes.

CHAPTER 06

Library, delivery and your DAW

When the song feels right, **Deliver** gives you one MIDI file per part plus a structure file, named so you always know what is inside.

Deliver

The Deliver window

1. **Name the production.** The name goes into every file name.
2. **Pure or Polished.** Pure keeps exactly what you made, with your feel. Polished nudges notes into key and chords, gives every part its own range and balances loudness.
3. **Played by.** Choose the plugin per part right here, if you have not done so in the slots.
4. **Download.** Each row has its own download button for a single .mid file. **Download all as one .zip** gives you everything as it is at that moment, in one file.

Download as MP3. The whole song as one .mp3, exactly as you hear it in the app, with its own sketch sounds. Handy to listen back or to send to someone; the plugins in your DAW will sound different.

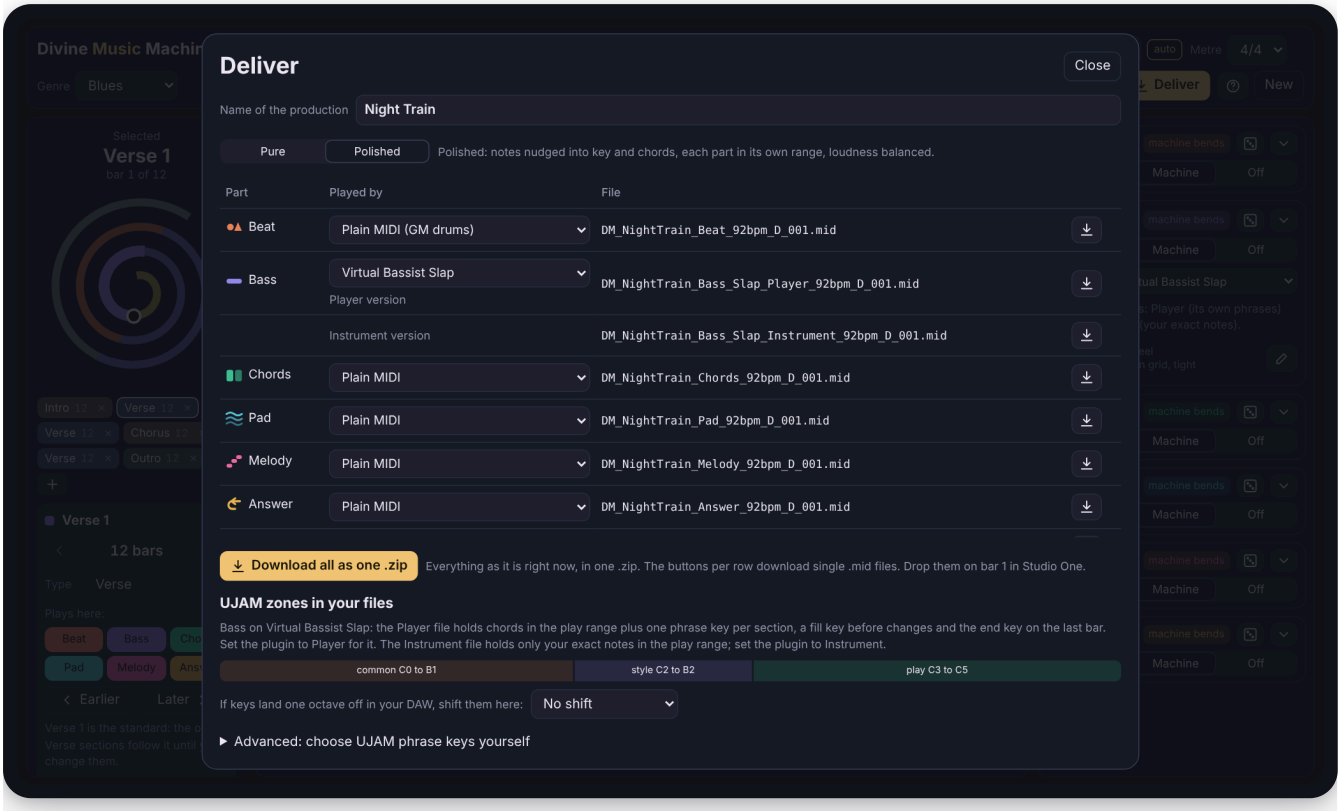

Share

The link is the song. Press **Share** in the top bar: on a phone the share menu opens (WhatsApp, mail), on a computer the link is copied. Whoever opens it sees a calm listening page with your song's name, the spiral and one big Play button, plus **Download as MP3** and **Download MIDI (.zip)** with the same files you would deliver. **Make your own** opens it in the full app as their own copy; your song stays yours. Your song also lives in the address bar, so copying the address shares it too. The link holds the song as it is at that moment: after a change, share again.

A file name reads like a label:

PIECE	EXAMPLE	MEANING
Brand	DM	Divine Monday
Production	NightTrain	The name you gave it
Part	Bass	Beat, Bass, Chords, Pad, Melody, Answer or Structure
Plugin and version	Slap_Player	Only when a UJAM plugin plays it
Tempo	92bpm	Beats per minute
Key	D	The key of the song
Number	001	Goes up with each new delivery; the same song keeps its number

UJAM plugins: two versions

Deliver with Virtual Bassist Slap: a Player and an Instrument file

UJAM plugins listen to different key zones: low keys switch phrases and styles, the play range plays notes. The machine places every key in the right zone for you, and for the Virtual Guitarist and Virtual Bassist plugins you get two files:

Player version

Chords in the play range, plus one phrase key per section, a fill key before changes and the end key on the last bar. Set the plugin to Player mode. UJAM plays its own phrases along your chords.

Instrument version

Only your exact notes, folded into the play range. Set the plugin to Instrument mode. You hear exactly what you wrote.

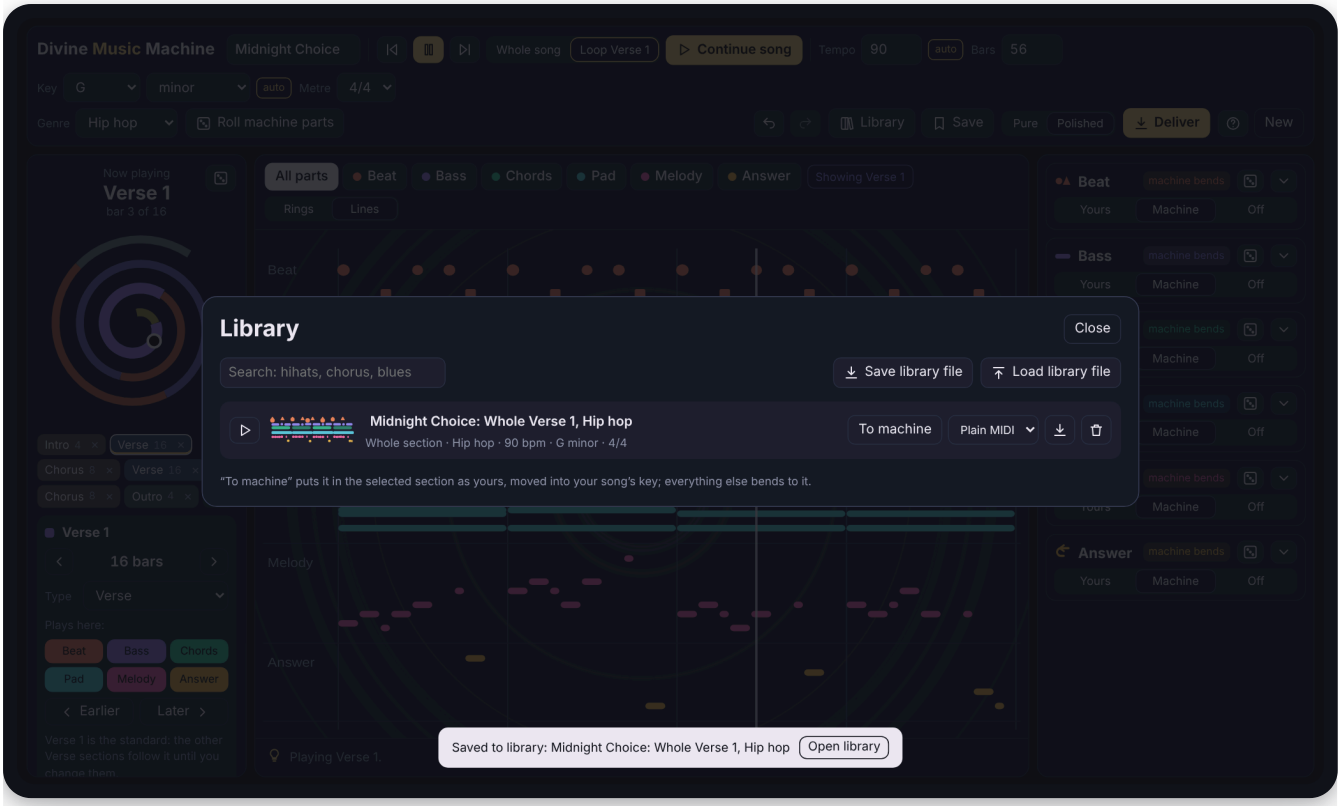

Virtual Pianist Score and Usynth get a single file. Notes are named with C3 = 60, the way UJAM and Studio One show them. If keys land one octave off in your DAW, pick a shift under **If keys land one octave off**. Under **Advanced** you can choose the phrase keys per section yourself.

PLUGIN	GOOD FOR
Plain MIDI (GM drums)	Any drum instrument with the General MIDI layout
XLN XO, Impact XT, BABY Audio Tekno	Beat, mapped to their pads
Virtual Guitarist Silk 2, Iron 2, Cinedream, Carbon	Chords, melody or bass on guitar
Virtual Bassist Royal, Slap	Bass, melody or chords on bass
Virtual Pianist Score	Chords, melody or bass on piano
Usynth	Chords, melody or bass on synth
Plain MIDI	Any instrument you like

Into Studio One

1. Download the zip and unpack it.
2. Drop the files on **bar 1** in Studio One. Tempo and time signature travel inside the files.
3. The Structure file carries the section markers, so you see Intro, Verse and Chorus on your timeline.
4. Put each part on its instrument. For UJAM, pick the Player or Instrument file and set the plugin mode to match.

Library

The library

Save keeps a single part, a whole section, or the whole song with its spiral; a saved song opens again with Open, and undo brings back the song you had. In the library you can search, press play to preview, download, or press **To machine**: it lands in the selected section as yours, moved into your song's key, and everything else bends to it.

The library and your last song live in this browser. Browsers can wipe their storage, so press **Save library file** now and then, and **Load library file** to bring it back, on any computer.

CHAPTER 07

Quick reference and tips

Keep this page close for the first sessions; after that your hands will know.

I WANT TO...	DO THIS
Hear a note or hit	Tap it once
Remove a note or hit	Double tap it
Make something louder	Drag a beat hit outward, or hold a note and push the fader up
Keep a machine suggestion	Tap the dashed shadow
Get a fresh idea for one part	The dice in its slot
Let the machine fill the rest	Machine, take it from here
Change the groove	Drag the dot in the Feel pad
Hear only this section	Loop in the top bar
Carry on after editing	Continue song
Know which genre I am in	Suggest (in Free flow)
Start a brand new song	New
Take back anything	Undo, or Ctrl+Z
Play or pause	Space
Jump between sections	Tap a section, or the left and right arrows
Get everything out	Deliver, then Download all as one .zip

Tips from the council

Start small

One Verse and one Chorus with a beat you love beats ten sections you do not.

Let one part lead

Make the bass yours and leave the rest on Machine: everything bends around your line.

Feel before notes

Try the Feel pad before you rewrite a part. Laid back and loose often is the whole answer.

Pure for sketches, Polished for sessions

Polished is ready to drop into a mix.

Save the library file

Now and then. Your future self will thank you.

The help button

(the question mark in the top bar) shows the short version of this manual inside the app.
