CHAPTER 01

Welcome to the groove

The Divine Groove Machine is pure beat. You build every hit yourself, the machine helps with suggestions, and you shape a whole arrangement from intro to outro. What comes out is clean MIDI with section markers, ready for XO, Impact, Tekno, Beatmaker or Playbeat in your DAW.

A few promises before you start:

Nothing breaks

Every change can be undone with the arrows in the top bar, or Ctrl+Z.

You hear it right away

Every tap sounds, also while the music plays.

You stay the drummer

The machine only suggests, unless you ask it to build.

Help on every screen

Press 💬 Explain and tap any button to read what it does.

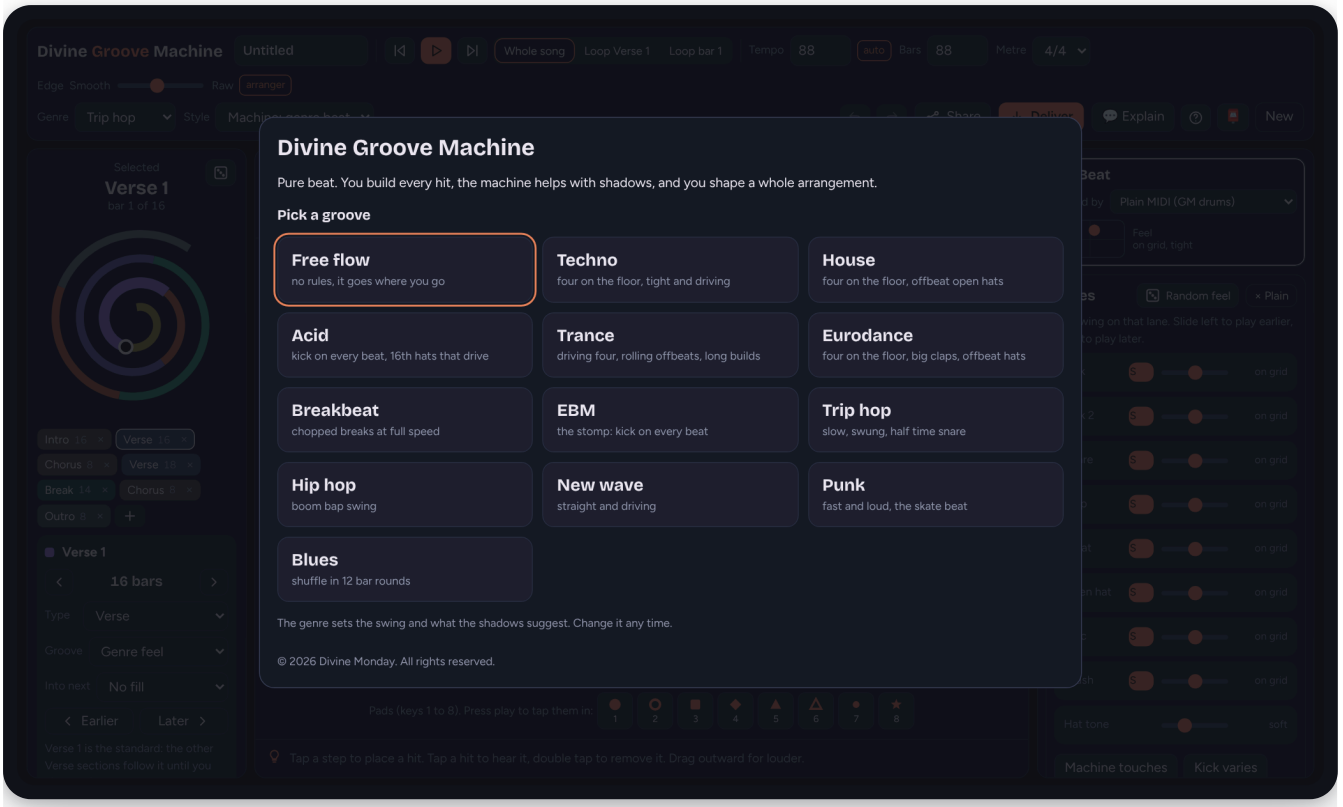

CHAPTER 02

Start and the screen

Two steps and you are in: pick a groove, then find your way around one calm screen.

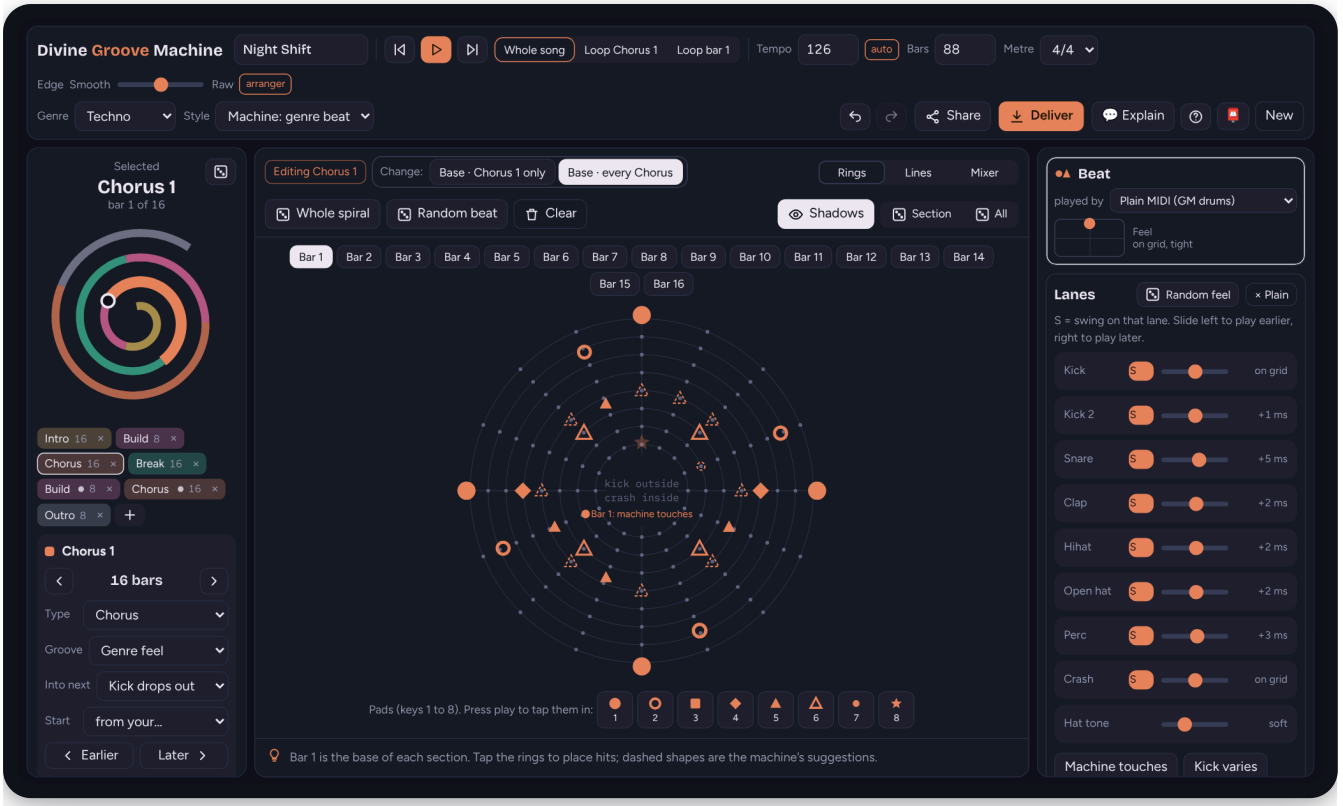

Pick a groove

Pick a groove

The first screen asks for a genre. It sets the swing, the tempo and what the suggestions sound like: Free flow, Techno, House, Acid, Trance, Eurodance, Breakbeat, EBM, Trip hop, Hip hop, New wave, Punk or Blues. You can change it any time in the top bar; the tempo comes along. Then choose how to start: **Machine makes a groove** gives a whole song of beats right away, **From scratch** gives an empty spiral for your own hits.

The screen at a glance

The Groove Machine with a techno beat in Rings

Top bar

Song name, play, Whole song or Loop, tempo, bars, metre, the Edge slider, genre, Style, undo, Share, Deliver, 💬 Explain, help, 🚨 feedback and New.

Left

The spiral is your whole song from the centre out. Below it the section chips and the panel of the selected section.

Centre

The editor: Rings, Lines or Mixer, with the machine's buttons in the row below.

Right

The Beat card with the plugin and the Feel pad, and below it the Lanes panel.

CHAPTER 03

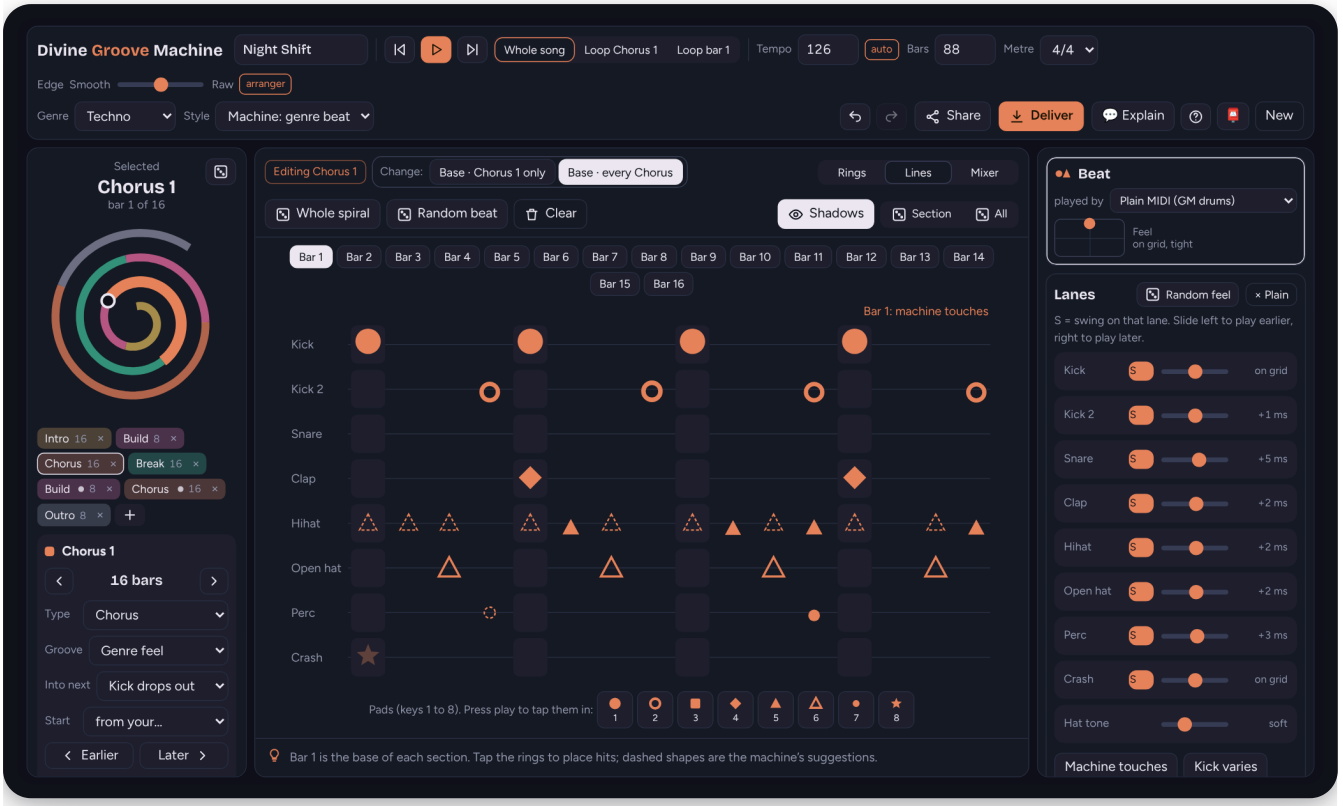

Building your beat

Every hit is yours. The rings, the lines and the pads are three ways to place them.

Rings and Lines

One ring per drum, the bar runs clockwise from the top. Kick sits outside, crash inside. Further out on a ring is louder. **Lines** shows the same beat as a row per drum. Tap to place a hit, double tap to remove it.

The same beat in Lines

RING	DRUM	SHAPE
1 (outside)	Kick	circle
2	Kick 2	ring
3	Snare	square
4	Clap	diamond
5	Hihat	triangle

RING	DRUM	SHAPE
6	Open hat	open triangle
7	Perc	dot
8 (inside)	Crash	star

Bar 1 is the base

What you place in bar 1 plays in every bar of the section. In the other bars you start from that base and change only that bar; its tab gets a dot. **Change** above the editor shows where your next change lands: this bar, this section, or every section of its type.

Shadows, Random beat and Clear

Shadows are dashed shapes: the machine's suggestions. Tap one to keep it. 🎲 **Section** gives other suggestions for this section, 🎲 **All** for every section. **Random beat** puts a real beat where your change lands; **Clear** empties it.

Pads 1 to 8

Under the editor sit eight pads. Tap one to hear that drum. While the song plays, tap the pads or keys 1 to 8 to play hits in, right in the bar you hear.

CHAPTER 04

The whole song

A beat becomes a track when it travels: sections, a groove per section, fills, and an arc from intro to outro.

Sections and the spiral

The chips on the left are your sections in order. Tap one to select it, drag to reorder, **+** adds one, the x deletes it. The panel sets the length, the type, the **Groove** and **Into next**. Sections of the same type follow the first one until you change them.

GROOVE	FEEL
Genre feel	The swing of the genre
Straight	No swing
Dilla, lazy	Snare and clap late and loose
Ghost notes	Soft snares around the backbeat
Chicago shuffle	Heavy swing
Pushed	Everything a little ahead
Laid back	Everything a little behind

Into next chooses the last bar before the next section: no fill, a snare roll, a build up roll, the kick dropping out, a stop on the last beat, a gift of silence followed by a crash, or a crash into the next section.

The section panel: length, type, groove and Into next

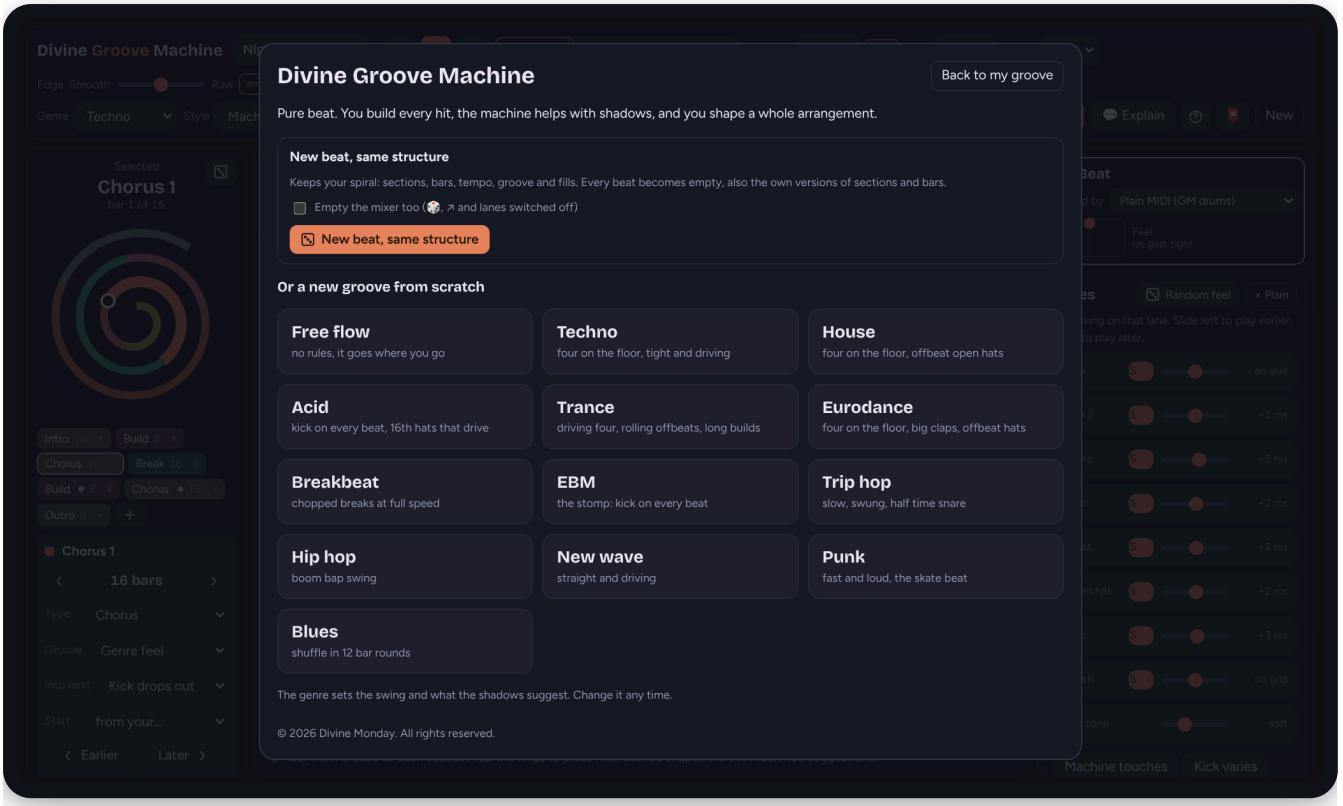

Whole spiral

Press **Whole spiral** and the machine builds a beat for the whole song: one core groove, and every kind of section its own version of it. An energy curve runs through the song: a bare intro, hats that grow through every build, a full drop or chorus, a break with a soft pulse where the kick comes back in the last two bars, and a calm outro. A section that comes back is a light variation, never a copy, and sections of 8 bars or more move by themselves. Does a section already have a beat? Then you choose **Only the empty sections** or **Everything new**.

Copy beat

Copy beat of Chorus 1 to every Chorus in the section panel first asks what comes along: **Exactly as you hear it** (bar 1, your changed bars, the bars the machine or the mixer plays a little different, and the mixer; those bars get a dot) or **Only the base** (just bar 1).

New beat, same structure

New: a new beat on the same structure

Press **New** in the top bar. **New beat, same structure** keeps your spiral, tempo, groove and fills and empties every beat. Tick **Empty the mixer too** for a clean mixer. The button asks once more, and Undo brings everything back.

CHAPTER 05

Make it move

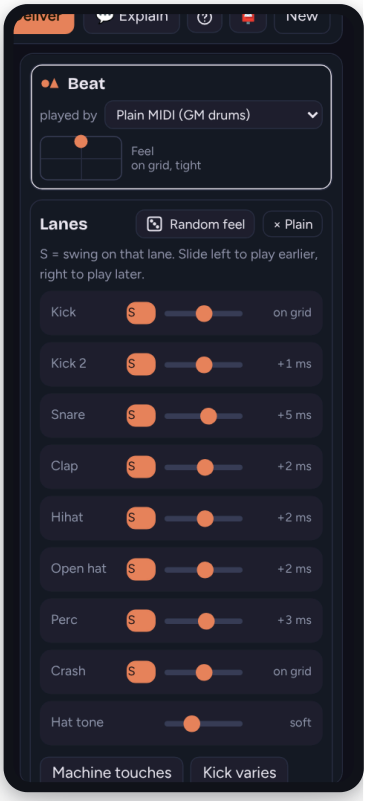

A loop that repeats for three minutes tires the ear. These tools let every drum breathe from bar to bar.

Lanes and Random feel

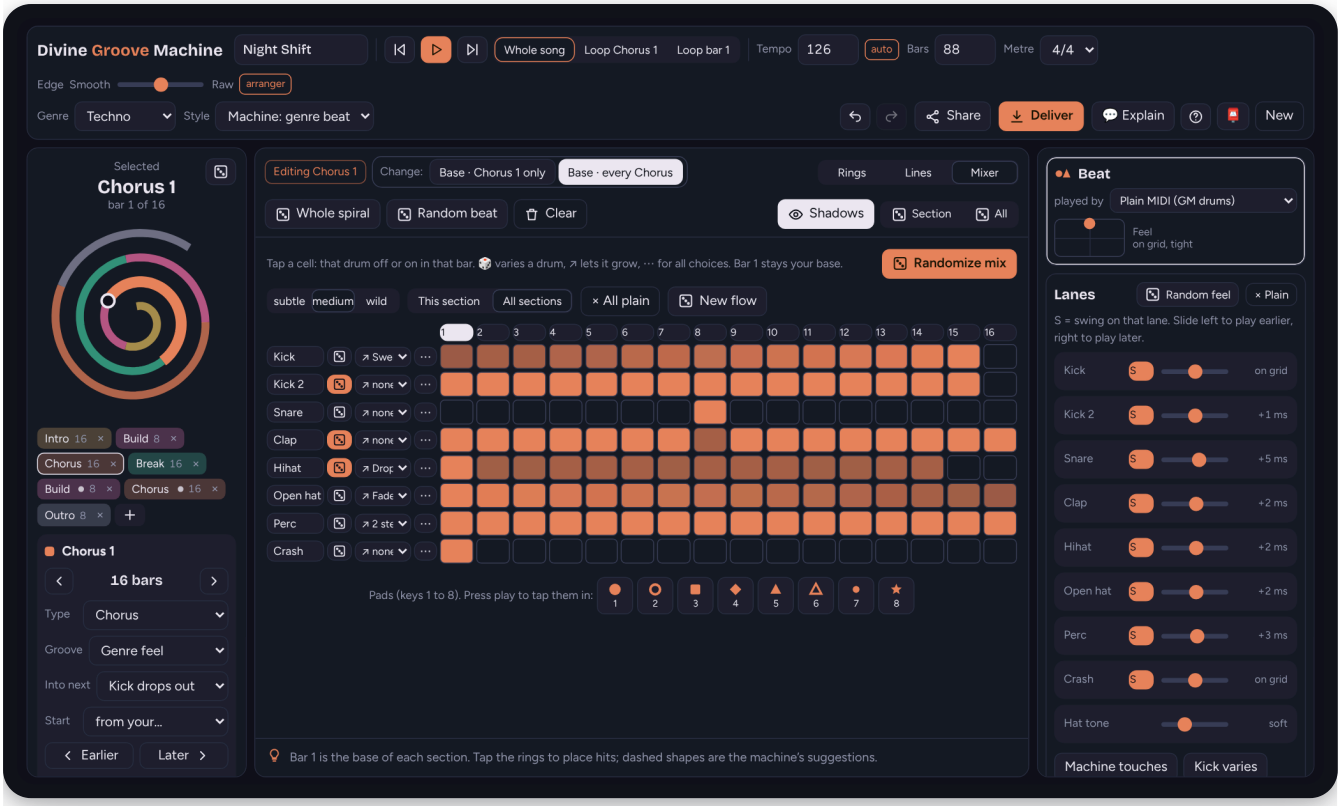

The **Lanes** panel on the right has a row per drum. **S** switches swing on or off for that drum. The slider moves it earlier or later, up to 30 ms. 🎲 **Random feel** chooses a musical feel: kick tight on the grid, snare and clap a little late, the hats floating. **× Plain** puts everything back. **Hat tone** only changes how the hats sound in the app. **Machine touches** adds a drummer's small changes from bar to bar: ghost notes just before and after the snare on 2 and 4, a soft extra hat, an open hat at the end of a phrase, never on a kick. **Kick varies** lets the kick move now and then too.

The **Feel pad** in the Beat card sets the overall timing: left is ahead, right is laid back, down is looser. The timing drifts slowly across the bar like a person, and a hard hit lands a fraction later than a soft one. The same groove always plays the same way.

The Lanes panel

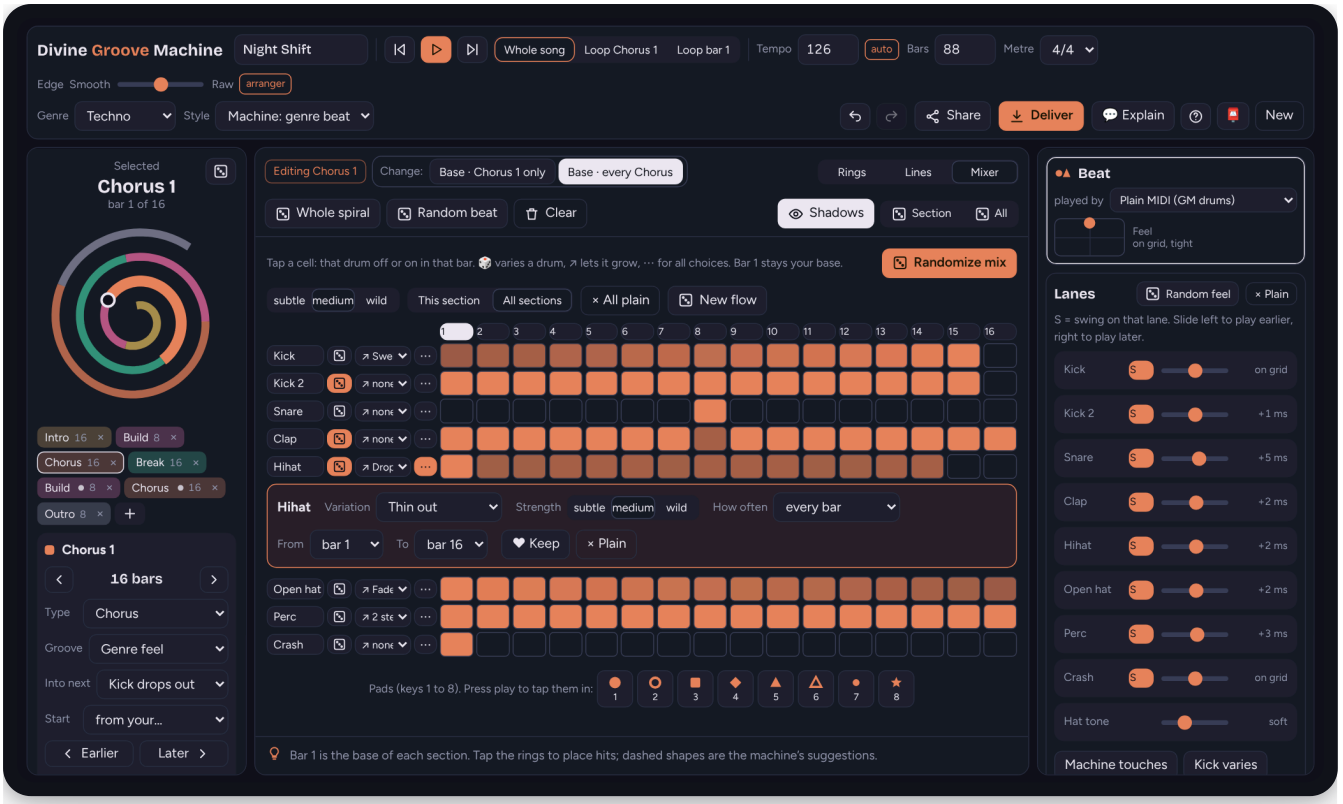

The Mixer

The Mixer after Randomize mix

Press **Mixer**, next to Rings and Lines. Every drum, every bar of the section. A brighter cell plays more.

YOU WANT	DO THIS
A drum silent in one bar	Tap its cell
Silent in the whole section	Tap its name
Let it vary	🎲 next to its name; tap again for another variation
Let it grow	↗ In, Out, Swell, Fade, Stair, Wave, Accent walk, Opens, Ends in 16ths or Drops out
Every choice	··· opens the kind of variation, subtle to wild, how often, which bars, and ♥ Keep
A mix for every drum at once	**Randomize mix**, subtle, medium or wild
The same choices, a new way through	**New flow**
Back to how you wrote it	**× All plain**

All choices for one drum

This section or **All sections** decides where Randomize mix, New flow and All plain work. Every drum that really plays gets a 🎲 or a ↗; a drum that plays in only one bar is left alone. The kick stays the anchor, the backbeat stays, a build keeps building, and bar 1 always stays your base. With only shadows in a section the mixer says so.

Explain

Press 💬 **Explain** in the top bar: a tap on any button now tells you what it does, and nothing changes. Press it again to work as usual. On a phone you can also press and hold a button; on a computer, rest the mouse on it. The help window (the question mark) shows the version of the app at the bottom.

CHAPTER 06

Arranger, Edge and Style

New grooves come with an arranger: per section it decides how the drums come in, where the breaks fall and how each section ends, so no two grooves feel the same.

Edge: smooth or raw

The **Edge** slider runs from Smooth to Raw. Smooth keeps the groove polished. Raw adds accents, ghost notes, bolder dynamics and small surprises.

Style

Style picks the groove family: the genre beat, funk, disco rock or latin. It starts on Machine, which picks what fits the genre. Choose one yourself to lock it.

Played like a person

Every hit is humanized: the hihat has two hands, flams and rolls breathe, and each genre has its own pocket. Drag the Feel pad toward Tight to play it straight. In four on the floor genres the kick always stays on the grid.

Feedback

The 📮 button opens a mail to Divine Monday with the app and version filled in. Every idea is welcome.

CHAPTER 07

Deliver and share

When the groove feels right, it goes into your DAW or to a friend in one tap.

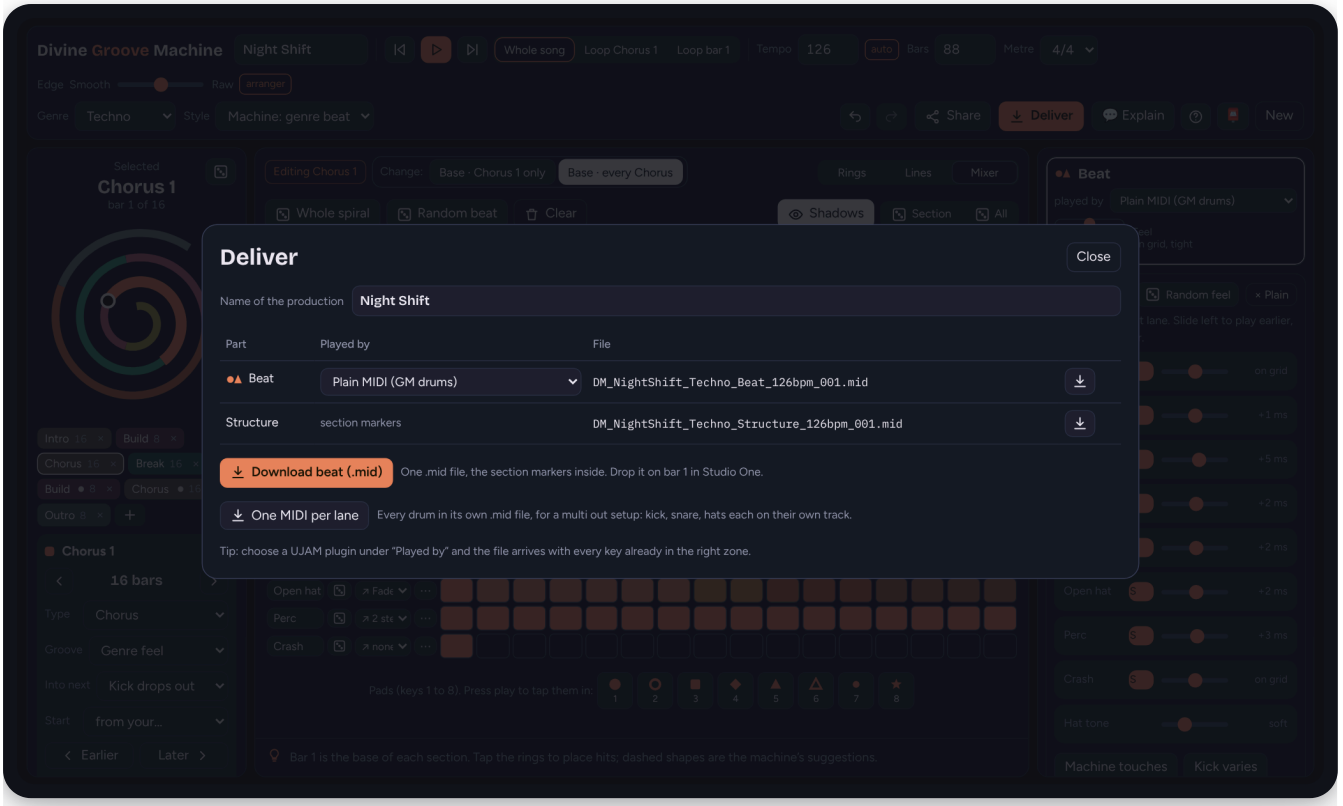

Played by

Choose your drum plugin in the Beat card or in Deliver. The keys land right for it:

PLUGIN	KEYS
Plain MIDI (GM drums)	General MIDI drum keys
XLN XO, Impact XT	Eight pads from C1
BABY Audio Tekno	Its own pad keys
UJAM Beatmaker 3	Only the white keys, so no loop keys start by accident
UJAM Virtual Drummer	LEGEND, BRUTE and the others: kick, snare, hats and crash on their own keys; kick 2 plays the low tom, the clap the snare rim, perc the sidestick
Toontrack EZdrummer 3	Its standard map: kick, snare, hats and crash on their own keys; the clap plays the snare rimshot, perc the sidestick
UJAM Beatmaker 2 (old)	The older instrument layout
Audiomodern Playbeat 4	Eight channels, C1 to G1; set Playbeat's own sequencer to stop

Deliver

The Deliver window

Download beat (.mid) gives one MIDI file with the section markers inside: drop it on bar 1 in Studio One and you see Intro, Verse and Chorus on your timeline. **One MIDI per lane** gives every drum its own file, for a multi out setup. File names read like a label: DM, the song name, Beat, the plugin, the tempo and a number.

Share

Share makes a link that plays your groove for anyone, on a calm listening page. **Make your own** turns it into their own copy in the app; your groove stays yours. Paste a link into an open Groove Machine and it opens too.

CHAPTER 08

Quick reference and tips

Keep this page close for the first sessions; after that your hands will know.

I WANT TO...	DO THIS
Place or remove a hit	Tap, or double tap
Keep a suggestion	Tap the dashed shadow
Other suggestions	🎲 Section or 🎲 All
A beat for the whole song	Whole spiral
Every bar breathing	Mixer, Randomize mix
A human feel	Lanes, 🎲 Random feel
A fill into the next section	Into next in the section panel
Start over on the same structure	New, then New beat, same structure
Learn what a button does	💬 Explain, or press and hold
Get it into my DAW	Deliver
Take back anything	Undo, or Ctrl+Z

Tips from the council

Build the chorus first

Make one section you love, then let Whole spiral fill only the empty sections around it.

Three taps to a song

Whole spiral, Mixer on All sections, Randomize mix. Then make it yours.

Less is a build

Let the intro and the break breathe; the drop hits harder after them.

Feel before hits

Try Random feel and a Groove before you add more notes.

The kick is the anchor

Keep it simple and let the hats and perc talk.
