Tips from the council

01 Welcome

Divine Score Machine writes music for a scene. You choose what the scene should feel like, you draw how the tension moves, and the machine writes two MIDI files: one for STRIIIINGS and one for PERRCS. Drop them in your DAW and the two plugins play a score that rises, holds its breath and lands.

What you need

UJAM Symphonic Elements STRIIIINGS and PERRCS, and a DAW such as Studio One. The app runs in your browser, on a computer or a phone. Nothing to install, nothing to sign up for.

No AI inside

Every note comes from music rules and a seeded dice. The same choices always give the same files, so you can come back to a score and get exactly what you had.

02 Set up the two plugins

Do this once per project. Both plugins play their own recorded phrases; the files tell them which phrase, which chord and when.

1. Load STRIIIINGS on one instrument track and PERRCS on another.
2. Switch Latch off in both.
3. Set Sync to Note in both.
4. Drop each file on bar 1 of its track.

The swell line rides the mod wheel. In both plugins the mod wheel dials in a decrescendo: the higher the wheel, the softer they play. The app writes it the right way round for you.

03 Pick a feeling

The question at the top is the one a film composer asks first: what should your scene feel like? Each feeling has its own recipe of key, chords, tempo, phrases and percussion.

LIGHT

Playful
like a comedy: bright, bouncy, hits on the jokes

Light
carefree: major chords up high, floating strings

Wonder
like a documentary: open chords, a slow swell

Tender
like romance: long lines, full chords

Euphoric
hands in the air: a ladder up in every build

Ecstasy
beyond the peak: the top that will not let go

Glory
the victory: heroic chords, big hits

Nostalgic
looking back: a major key that borrows the minor four

Hope
light after the dark: minor that turns major

Triumph
we made it: a hit on every peak

Dreamy
half asleep: chords that drift up high

Serenity
calm water: two chords that rock gently

Sunrise
a new day: from low and quiet to wide open

DARK

Dark
deep shadow: low phrases and a drone

Depressed
heavy hearted: a bass that walks down, softer each time

Tense
like suspense: a pedal tone, metals in the air

Fearful
like horror: a half step that never resolves

Mysterious
like film noir: smoke, shadow, a lonely cymbal

Confused
lost the thread: chords that slip, odd lengths

Uncanny
like avant garde: tritones and rules bent on purpose

Heartbreak
something broke: falling chords, a lonely high line

Lonely
on your own: one high line, long silences

Grief
saying goodbye: a bass that walks down step by step

Rage
all fire: low phrases at full force

Danger nearby
something is coming: a pedal that will not move

STORY

Chase
like a thriller: driving, fills into every peak

Solving the plot
it all falls into place: minor that turns major at the end

Adventure
the journey begins: bold steps, a ladder into every peak

Showdown
the duel: one long tone, then hit after hit

Countdown
the ticking clock: one key up every two bars

04 Start from

Film score

The machine writes the whole score: a structure with an intro, themes, builds, peaks, a film moment and an outro, in a key that suits the feeling. Tap New score for a fresh one in the same feeling.

With my track

Already have a song? Export the chords as a MIDI file and drop it on the With my track card, or anywhere on the page. The machine finds the key and the chord of every bar, and Strings and Percs follow your harmony. Markers in the file become sections (a marker named Chorus becomes a Peak, Break becomes a Film moment). No markers: the machine makes blocks of eight bars and marks the busy ones as peaks.

In Studio One: select the part with your chords, choose Export as MIDI file, and drop that file in the app.

05 The tension arc

Draw it

The orange line is the tension, bar by bar. Drag across it with your mouse or finger to draw your own; the dashed line stays as the machine's suggestion. Double click to give the line back to the machine. Low tension picks calm phrases low on the keyboard; high tension picks intense ones, hits and additions.

Spice, Colour, Film

How much of the score plays. Spice: only the moments that matter, a build, the film moment, the ending. Colour: strings in the peaks and breaks, percussion where it lifts. Film: everything, the score takes the lead.

Film moment

A few bars before the last peak where your track holds its breath: the strings sit on a pedal tone while the chords move above it, and only metals hang in the air. Switch it on or off at the top, or set any section to Film moment.

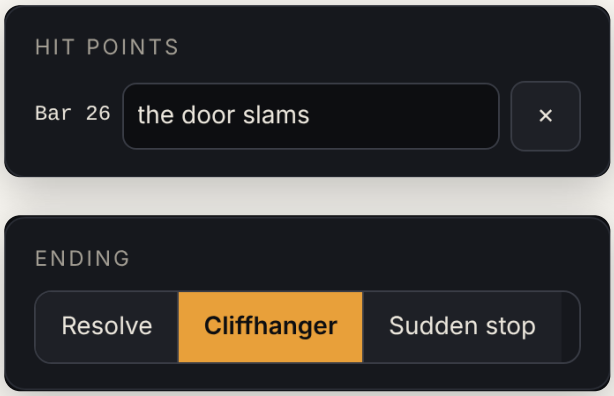

Swell

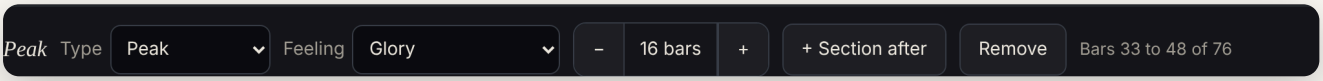

The grey line is the swell: the breath of the score, written as the mod wheel. Draw it the same way as the tension.

06 Shape the story

Hit points

A moment in your film, like a door that slams. Tap a bar in the Hits row under the tension line: a fill runs into it, the hit lands exactly on that bar and the strings add a layer. Give it a name on the right; the name travels into your DAW as a marker. Tap the bar again to remove it.

A feeling per section

Every section can have its own feeling. Tap a section and choose Feeling: a Mysterious intro, a Glory peak, the rest of the score as it was. Same as the score brings it back.

Ending

Resolve comes home with an ending phrase and a closing hit. Cliffhanger ends open on the five, with a hit and a metal that hangs in the air. Sudden stop cuts everything at once on the last bar.

Tempo that moves

Fill in a second tempo after the word to, next to Tempo. The score speeds up or slows down bar by bar, and the files carry every tempo change, so your DAW follows. Leave it empty for a steady tempo.

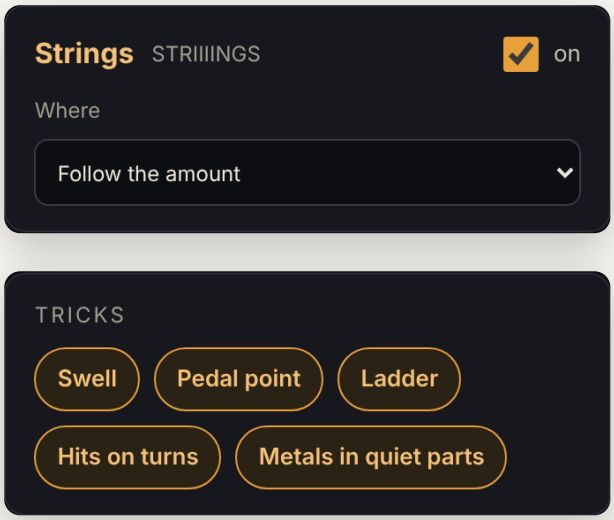

07 Strings and Percs

Strings (STRIIIINGS)

plays a phrase on the low keys, your chord in the play range and its own bass note. The phrase follows the tension, the chord follows the harmony, and in a film moment the bass stays on one note.

Percs (PERRCS)

plays Common phrases when it is calm and Style phrases when it builds, an Intro key at the start, Hits on the turns, Metals in quiet bars, Fills before a peak and an Ending at the close.

Where

Per part: follow the amount, everywhere, only builds and peaks, or only the quiet parts.

Tricks

Swell (the mod wheel line), Pedal point (the held bass), Ladder (one key up every two bars in a build), Hits on turns, Metals in quiet parts. Switch any of them off.

Sections

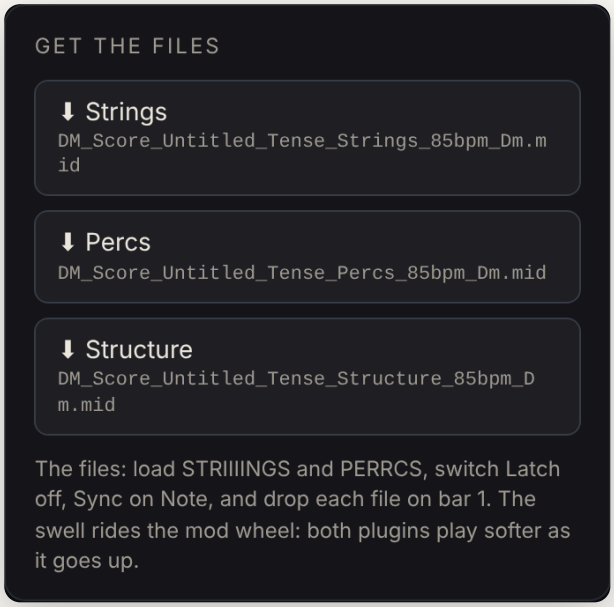

Tap a section to change its type and length, add one after it or remove it. The lanes below show in words what each plugin plays there.

08 Get the files

Download all gives three files: Strings, Percs and Structure. Or download them one by one in Get the files. The names tell you what is inside: DM_Score, the name, the feeling, the part, the tempo and the key.

1. Set the song tempo to the tempo in the file name.
2. Drop Strings on the STRIIIIINGS track at bar 1.
3. Drop Percs on the PERRCS track at bar 1.
4. Drop Structure on any track to get the section markers.

Then make it yours: pick the Style in each plugin, move the crossfader, add reverb. The files are the arrangement; the sound is up to you.

09 Quick reference

Draw	drag on a line
Back to the machine	double click the line
New idea	New score
Your song	drop chord MIDI anywhere
Plugins	Latch off, Sync Note
Swell	mod wheel up is softer
Hit point	tap a bar in the Hits row
Own feeling	Feeling, in the section editor
Ending	Resolve, Cliffhanger, Sudden stop
Speed up	a second tempo after to

Tips from the council

Emperor	Start with the feeling, then draw one clear arc. A score needs one big moment, not ten.
Professor	Let the pedal tone do the work in a film moment: the same bass under moving chords is pure suspense.
Technical prince	Keep Latch off and Sync on Note, then every phrase starts exactly where the file says.
Princess	Spice is often enough in a pop track. One film moment before the last chorus can carry the whole song.
